item brief company profile

item Industrietechnik and Maschinenbau GmbH has been developing and distributing the industrial Building Kit System since 1976. The Building Kit System is based around a series of aluminium profile sections, numerous corresponding fasteners and a wide selection of functional elements. This Building Kit System is ideally suited to the construction of special solutions in the field of production machinery: ergonomic workplaces, individually constructed enclosures and guard systems or integrated handling equipment are just a few of the numerous conceivable sample applications.

item is active on a worldwide basis. A closely coordinated network of service centres located in close proximity to key industrial centres around the world ensures that users have rapid access to professional services locally, ranging from advisory to project planning services and the short-term supply of all system components.

As new products are designed, the key aspects of innovation and design are weighted equally. This is evidenced by the large number of patents and design patents for products in the MB Building Kit System, many of which have won awards at international design competitions.
